| DESCRIPTION | | |
| <p>Newmar Corporation is issuing a TSB for 2017-2018 Dutch Star (43') motorhomes built on a Spartan Chassis.</p> <p>In reverse at full turn, the tread portion of the driver's side front tire may make contact with the jack spring.</p> <p>In the event of a customer concern, a Spartan service center may reduce the turning radius of the front tires to ensure the tires do not make contact with the jack spring.</p> <p>If the tire does not contact the jack spring, <u>no repair</u> will be performed.</p> | | |
| RECOMMENDED ACTION | | |
| <p>Contact Spartan at 855-589-9836 for authorization and to schedule and complete the procedure. Spartan will ship the parts kit to an authorized Spartan service center to perform the update. The attached work instructions were provided by Spartan.</p> <p>Labor time: 1.0 hr. (as determined by Spartan)</p> <p>Note: Newmar will not be authorizing this repair. Spartan will authorize and schedule this repair. If you require help contacting Spartan, contact your Service Account Manager at Newmar for assistance.</p> <p><u>Please read this bulletin in its entirety prior to beginning any diagnosis or repairs.</u></p> | | |

Work Instructions to Adjust Turning Radius and Reset Poppets

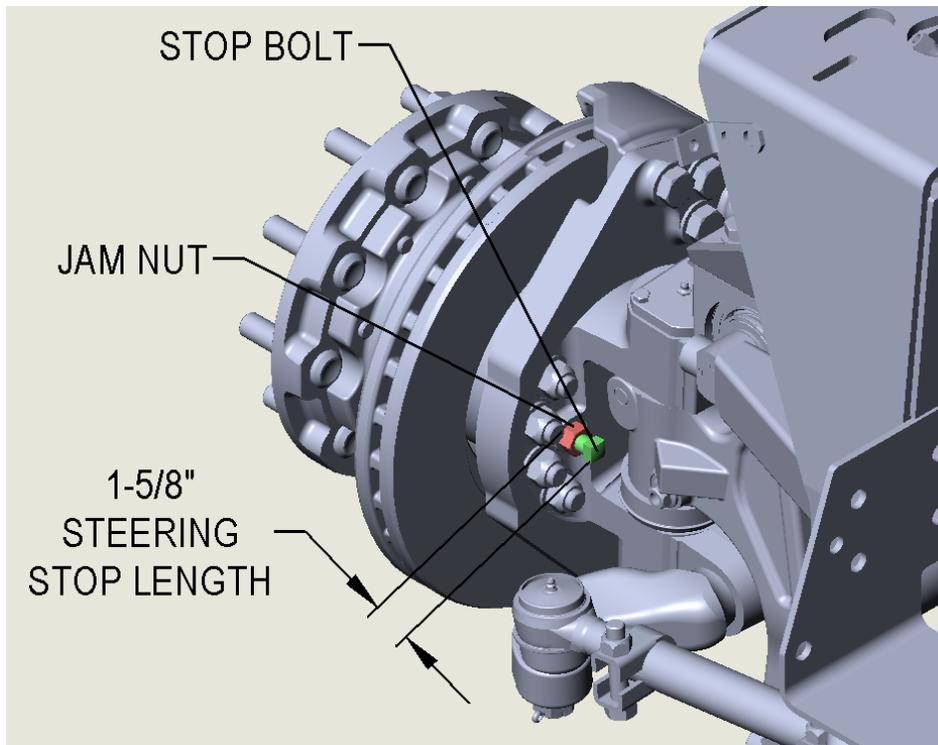

ADJUSTING THE WHEEL TURN ANGLE

The steering stop bolt on the steering knuckle controls the maximum turn angle. If the stop bolt is missing, bent, or broken; replace the stop bolt(s) or jam nut(s) and follow the procedure below for adjustment.

CAUTION:

The steering stop bolt on the steering knuckle controls the maximum turn angle. If the stop bolt is missing, bent, or broken; replace the stop bolt(s) or jam nut(s) and follow the procedure below for adjustment.

1. Loosen the jam nut on the stop bolt.
2. Turn the stop bolt until the steering stop length measures 1-5/8".
3. Tighten the jam nut to 50-75 ft-lb.
4. Repeat the adjustment for turning the opposite direction.

Because the steering stop bolts are adjusted to reduce wheel turn angle, the steering gear poppet valves will require readjustment. If the poppets are not re-adjusted properly, then the steering gear will not reduce power assist properly and steering components will be damaged.

POPPET RESETTING

This resetting procedure will work in most cases with at least 13/4 hand-wheel-turns from each side of center. If you're making a large reduction in wheelcut and this procedure does not work, you may have to replace or internally reset the poppets using the procedure described in the appropriate gear service manual.

1. Set the axle stops to vehicle manufacturer's wheelcut or clearance specifications.
2. Make sure the engine is off and the road wheels are in straight ahead position.
3. Remove and discard the poppet fixed stop bolt and washer (Figure 1, if equipped) from the lower end of the housing on both the main gear and the rotary cylinder. If either unit has a poppet adjusting screw and jam nut that need to be replaced, remove and discard them at this point also.

Figure 1

If a new poppet adjusting screw and nut are being used, turn the screws into the non-sealing end of the jam nuts until the Allen drive end of the screw is flush with the nut. (Figure 2)

Figure 2

CAUTION:

Be sure the Allen drive end of the screw is not below the face of the nut. Failing to keep it flush with the face of the nut will cause the poppet seat flange to break later on during this procedure.

4. If the adjusting screw is already part of the main gear (Figure 3) or rotary cylinder, back the nut off of the adjusting screw until it is flush with the Allen drive end of the adjusting screw.

Figure 3

5. Turn the new adjusting screw and jam nut (without rotating the jam nut on the screw) into the housing until the jam nut is firmly against the housing, on both the main gear and the rotary cylinder, using an Allen wrench. Tighten the jam nut against the housing.

6. Refill the system reservoir with approved hydraulic fluid.

CAUTION:

Do not mix fluid types. Mixing of transmission fluid, motor oil, or other hydraulic fluids will cause seals to deteriorate faster.

7. Place a jack under the center of the front axle and raise the front end of the vehicle so the steer axle tires are off the ground.

8. Start the engine and let it run at idle speed.

9. Note which output shaft timing mark is nearest the housing piston bore.

10. Turn the steering wheel in the direction that makes this timing mark move toward the adjusting screw you just installed (Figure 4) on the main gear. Turn in this direction until axle stop contact is made.

Figure 4

11. Pull hard (Figure 5) on the steering wheel (put 40 lbs. rim pull on a 20" dia. steering wheel) after the axle stop is contacted.

Figure 5

CAUTION:

Do not hold the steering wheel at full turn for more than 10 seconds at a time; the heat build-up at pump relief pressure may damage system components.

12. Turn the steering wheel in the opposite direction (end of timing mark points away from adjusting screw on the main gear, Figure 6) until the other axle stop is contacted.

Figure 6

13. Pull hard on the steering wheel.

14. Release the steering wheel and shut off the engine.

15. Loosen the jam nut and back out the adjusting screw, on both the main gear and the rotary cylinder, until 1" is past the nut (Figure 7). Tighten the jam nuts against the housings.

Figure 7

16. Start the engine and let it idle.

17. Turn the steering wheel, so that the timing mark on the main gear output shaft points toward the adjusting screw, until axle stop contact is made.

18. Pull hard on the steering wheel and hold it in this position for no more than 10 seconds at a time, then release to allow the system to cool.

19. Repeat this hold and release process while completing the following steps for both the main gear and rotary cylinder adjustments.

NOTE:

Pause the turning-in process each time the driver releases the steering wheel; continue turning the adjusting screw in only while the wheel is held at full turn.

Main Gear Adjustment

1. With steering wheel held at full turn, loosen the jam nut on the main gear, and hold it in place with a wrench so it will not contact the housing.

2. Turn the adjusting screw in (clockwise) using finger-pressure only (do not use a ratchet), until the Allen wrench stops. At this point, the adjusting screw has contacted the poppet seat. Do not attempt to turn it in farther.

3. Back off the adjusting screw $3\frac{1}{4}$ turns and tighten the jam nut. Torque the jam nut to 35 ft•lbs.

Rotary Cylinder Adjustment

1. Turn the steering wheel in the opposite direction, so that the timing mark on the main gear output shaft points away from the adjusting screw, until axle stop contact is made.
2. With steering wheel held at full turn, loosen the jam nut on the rotary cylinder and hold it in place with a wrench so it will not contact the housing.
3. Turn the adjusting screw in (clockwise) using finger-pressure only (do not use a ratchet), until the Allen wrench stops. At this point, the adjusting screw has contacted the poppet seat. Do not attempt to turn it in farther.
4. Back off the adjusting screw $3\frac{1}{4}$ turns and tighten the jam nut. Torque the jam nut to 35 ft•lbs.
5. The poppets on both the main gear and rotary cylinder have now been reset. Lower the vehicle. Check the fluid level in the reservoir and fill if required.

NOTE:

Do not remove the poppet adjusting screws, they are now part of the main gear and rotary cylinder assemblies.

NOTE:

The length of the poppet adjusting screw beyond the nut may be different for each vehicle, but must be no more than $1\frac{1}{16}$ " for proper thread engagement (Figure 8)
