DESCRIPTION OF PROBLEM																	
<p>In a small number of double sidewall vent installations has recently been observed that a down draft can be created in the flue tube while the RV is traveling down the road and the refrigerator is operating in gas mode. The downdraft condition is caused by the location of the refrigerator compartment in the coach and air currents created as the RV moves. In extreme cases, the downdraft can force the flame to abnormally heat the area around the burner box causing the temperature sensor to trip, which in turn shuts down the refrigerator.</p>																	
RECOMMENDED SOLUTION																	
<p>Norcold has created a flu tube cap that will block these downdrafts. See manufactures attached repair directions. Contact manufacturer directly for additional information or instructions.</p>
