DESCRIPTION OF PROBLEM																			
<p>Generator slide out brackets. Some units may be equipped with generator slide out brackets that the ball bearings fall out due to improper alignment, causing the track not to slide out properly and could also result in the generator dropping down.</p>																			
RECOMMENDED SOLUTION																			
<p>A visual inspection of the slide mechanism while moving the generator in and out of the storage location should allow one to determine if the slides have been properly installed. Some of the slides may be tipped out at the top causing the slides to work hard or may even cause the bearings to fall out.</p> <p>If the slides are on an angle, using flat washers to shim out. If ball bearings have dropped out, then the slides must be replaced. Old slides must be returned for credit.</p>
